SITE SELECTION ADVISORY STUDY

*Analysing Shopper Location Preferences
for Business Clothing in Delhi/NCR*

End-Term Project | Business Research Methods |

61

RESPONDENTS

5

SPSS TESTS

Mall vs. Downtown

Presentation Agenda

01

Research Context & Problem

Background, research gap and central question

02

Objectives & Methodology

Research design, sampling and SPSS toolkit

03

Descriptive Analysis

Respondent profile & overall location preference

04

Perception Comparison

Mall vs Downtown across 5 retail attributes

05

Statistical Tests

Chi-Square, T-Test, ANOVA — significance findings

06

Correlation & Factor Analysis

Relationship clusters & latent dimensions

07

Regression & Key Findings

Predictive model and consolidated insights

08

Recommendations & Conclusion

Evidence-based site selection advisory

Research Context & Problem

CENTRAL RESEARCH QUESTION

Which retail format — Shopping Mall or Downtown/High-Street — do Delhi/NCR consumers prefer for business clothing, and what perceptual attributes drive that preference?

Shopping Malls

Select Citywalk, Ambience Mall, DLF Promenade
Integrated parking · Climate control
· Foot traffic

Downtown / High-Street

Connaught Place, Nehru Place, South Extension
Metro access · Competitive pricing · CBD credibility

Research Gap

No empirical data currently guides this decision.
Retailers rely on intuition — not consumer evidence.

Research Questions & Methodology

3 RESEARCH QUESTIONS

- 01 Is location preference significantly associated with consumer perception?
- 02 Do consumer economic and demographic conditions affect their perception?
- 03 Whether factors such as budget, average spend, and transportation mode affect the location decision?

Age Distribution

Occupation Distribution

Overall Location Preference

SHOPPING MALL

57.4%

35 out of 61 respondents

- ✓ Assortment-driven shoppers
- ✓ Premium atmosphere seekers

DOWNTOWN / HIGH-STREET

42.6%

26 out of 61 respondents

- ✓ Price-sensitive shoppers
- ✓ Accessibility-focused buyers

Both formats are commercially viable — neither dominates overwhelmingly. Success depends on strategic alignment.

Multidimensional Scaling (MDS) – Shopper Perceptions

- **Purpose:** Instead of simple frequencies, MDS shows how shoppers mentally group the five perception variables.
- **Method:** 2D Euclidean distance model, excellent fit (Stress = 0.0048, RSQ = 0.9998).

Clusters Identified

- **Convenience:** Assortment + Accessibility
- **Experience:** Atmosphere + Service
- **Value:** Standalone

Implications:

- Shoppers form bundles of perceptions, not isolated ratings.
- **Malls** → stronger on *experience* + *assortment*.
- **High streets** → stronger on *price* + *accessibility*.
- Service reinforces atmosphere → improving service boosts experiential appeal.

Multidimensional Scaling (MDS) — Shopper Perceptions

Method: 2D Euclidean Distance Model | Stress (Kruskal's) = 0.0048 (Excellent Fit) | RSQ = 0.9998 (~100% variance explained) | N = 61

CLUSTERS IDENTIFIED

Experience: Atmosphere + Service (left quadrant)

Convenience: Assortment + Accessibility (right-center)

Value: Price (standalone — far right)

KEY IMPLICATIONS

- Shoppers form perceptual bundles — not isolated ratings
- Malls → stronger on Experience + Assortment
- High Streets → stronger on Price + Accessibility
- Service reinforces Atmosphere → improving service boosts experiential appeal

Model Fit

Stress < 0.05 = Excellent | RSQ ≈ 1.000 = Near-perfect representation of true perceptual distances

Chi-Square Test — Top Priority vs Location Choice

✓ STATISTICALLY SIGNIFICANT | $\chi^2(4) = 13.24$ | $p = .009$ | $p < 0.05 \rightarrow$ REJECT H_0

MALL SHOPPERS

54.3% prioritise
PRODUCT ASSORTMENT
'Variety under one roof'

DOWNTOWN SHOPPERS

57.7% prioritise
PRICE & VALUE
'Best deals, multi-brand'

Purpose: To test if top shopping priority is associated with location format preference

Independent Samples T-Test — Perception by Location Preference

Purpose: Do Mall and Downtown preferrers perceive retail attributes significantly differently?

Perception Variable	Mall Mean	Downtown Mean	p-value	Result
Product Assortment	2.11	2.81	.060	Borderline Trend ⚠
Accessibility	2.43	2.73	.320	Not Significant ✖
Store Atmosphere	2.06	2.35	.200	Not Significant ✖
Price & Value	2.94	2.31	.041	SIGNIFICANT ✔
Service Quality	2.49	2.62	.621	Not Significant ✖

KEY FINDING: Only Price & Value (p=.041) is statistically significant.

Downtown-prefers rate downtown significantly better on price. All other perceptions show no significant difference between the two groups.

One-Way ANOVA — Perception Differences by Age Group

3 of 5

variables
significant by Age

AGE
SEGMENTS

Age 20–26 →
Downtown
(price, access)

Age 27–35 →
Mall (assortment)

Perception Variable	F-Statistic	p-value	Result	Key Direction
Product Assortment	4.337	.018	SIGNIFICANT ✓	Age 27–35 favor Mall
Accessibility	3.802	.028	SIGNIFICANT ✓	Age 20–26 favor Downtown
Store Atmosphere	0.733	.485	Not Significant ✗	—
Price & Value	5.073	.009	SIGNIFICANT ✓	20–26: DT better; 27–35: Mall better
Service Quality	1.752	.182	Not Significant ✗	—

AGE IS THE KEY DEMOGRAPHIC
SEGMENTOR.

Younger shoppers (20–26) skew Downtown for price & accessibility. Older shoppers (27–35) skew Mall for product assortment.

ANOVA — By Occupation & Budget

ANOVA: BY OCCUPATION

Assortment	p = .845
------------	----------

Accessibility	p = .088
---------------	----------

Atmosphere	p = .450
------------	----------

Price & Value	p = .599
---------------	----------

Service Quality	p = .891
-----------------	----------

✗ NO significant results — Occupation does NOT predict location preference

ANOVA: BY BUDGET

Assortment	p = .037
-------------------	-----------------

Accessibility	p = .381
---------------	----------

Atmosphere	p = .118
------------	----------

Price & Value	p = .107
---------------	----------

Service Quality	p = .164
-----------------	----------

✓ Assortment p=.037: Economy shoppers favor Mall (M=2.15) more than Mid-Premium (M=2.86)

Correlation Analysis — Pearson Correlations

	ASSORTMENT	ACCESSIBILITY	ATMOSPHERE	PRICE	SERVICE
ASSORTMENT	1	.467 ** p<.01	.349 ** p<.01	.462 ** p<.01	.386 ** p<.01
ACCESSIBILITY	.467 ** p<.01	1	.454 ** p<.01	.465 ** p<.01	.458 ** p<.01
ATMOSPHERE	.349 ** p<.01	.454 ** p<.01	1	.034 n.s.	.619 ** p<.01
PRICE	.462 ** p<.01	.465 ** p<.01	.034 n.s.	1	.378 ** p<.01
SERVICE	.386 ** p<.01	.458 ** p<.01	.619 ** p<.01	.378 ** p<.01	1

KEY CORRELATION

Atmosphere ↔ Service
r = .619***

Assortment ↔ Access.
r = .467***

Atmosphere ↔ Price r = .034

These are completely independent dimensions — retailers can compete on price WITHOUT sacrificing atmosphere ratings.

TWO PERCEPTUAL CLUSTERS

Cluster 1 — Experiential:
Atmosphere + Service → Mall

Cluster 2 — Value:
Price + Assortment → Downtown

NGTH →

Very Weak < .10

Weak .10–.29

Moderate .30–.49

Strong .50–.69

Very Strong ≥ .70

Diagonal (self)

Discriminant Analysis — Group Separation & Classification

Grouping: Location (Mall=1 vs High Street=2) | Predictors: Assortment, Accessibility, Atmosphere, Price, Service | Method: Direct (Enter)

Tests of Equality of Group Means

Variable	Wilks' λ	F	p-value	Result
Price	.931	4.361	.041	Sig. ✓
Assortment	.941	3.687	.060	Trend ⚠
Accessibility	.954	2.822	.098	Marginal
Atmosphere	.974	1.580	.214	Not Sig. ✗
Service	.988	.694	.408	Not Sig. ✗

Canonical Discriminant Function

Eigenvalue = .202 | Canonical r = .410 (moderate separation)
Wilks' λ = .832 | $\chi^2(6) = 10.315$ | p = .112 (borderline)
Box's M p = .226 → Equal covariance matrices assumed ✓

Structure Matrix (Pooled within-groups correlations with function)

Price (.605)	Assortment (.556)	Accessibility (.486)	Atmosphere (.364)	Service (.241)
--------------	-------------------	----------------------	-------------------	----------------

Group Centroids on Discriminant Function

Standardized Discriminant Function Coefficients

Price: .644 #1	Assortment: .580 #2
Resp. ID: .602	Accessibility: .267
Service: -.462	Atmosphere: .074

Classification Accuracy — 65.6% Overall

Actual	→ Predicted Mall	→ Predicted HS	% Correct
Mall (35)	23	12	65.7%
High St. (26)	9	17	65.4%

KEY FINDINGS SUMMARY

01 Overall Preference

Descriptive

57.4% prefer Shopping Mall vs. 42.6% Downtown — both formats commercially viable

02 Only Significant Predictor

χ^2 $p=.009$ ✓

Chi-Square ($p=.009$): Top Priority drives choice — Mall→Assortment; Downtown→Price

03 Price Perception Differs

t-test ✓

T-Test ($p=.041$): Downtown-preferrers see downtown as significantly better on price

04 Age Matters Most

ANOVA ✓

ANOVA (3 sig. results): Age 27–35 favor Mall; Age 20–26 favor Downtown for price/access

05 Occupation: No Effect

Not Sig. ✗

No significant ANOVA results by occupation — job status does NOT predict preference

06 Two Underlying Factors

KMO=.631

Factor Analysis: 'Experiential Quality' (Mall) and 'Product Value' (Downtown) — 73.8% variance explained

CONCLUSION: Location preference is VALUE PROPOSITION driven — Assortment → Mall | Price → Downtown

Research Limitations

Small Sample Size

N = 61 limits statistical power and generalizability beyond the study group

Convenience Sampling

Non-probability sample is not representative of entire Delhi/NCR consumer population

Student-Heavy Sample

Majority PGDM students may not reflect the broader business clothing consumer base

Stated Preference Bias

Survey responses may not align with actual purchase behaviour in real settings

Geographic Concentration

Data collected primarily through LBSIM network, limiting geographic diversity

Cross-Sectional Design

Snapshot in time — does not capture how preferences may shift seasonally or over time

CONCLUSION

Location Preference is Value Proposition Driven

1

Mall Wins on Experience

Shopping Malls dominate on Assortment, Atmosphere, and Accessibility — confirmed across perception analysis and factor analysis (Experiential Quality Factor).

2

Downtown Wins on Price

Downtown has a decisive price advantage (57.4%) — the strongest single finding, confirmed by both perception data and the t-test ($p=.041$).

3

Align Store to Location

Retail success = Strategic fit between store positioning and location format. One significant predictor ($p=.009$): What you prioritise determines where you should be.

THANK YOU
